

8.5% of the global population lives in extreme poverty

Unveiling Global Trends: Socioeconomic Patterns Across Nations

By: Paula Cadena

We often view other countries as vastly different from our own, yet closer examination reveals a tapestry of shared experiences and common patterns. This project delves into the interconnected dimensions of population growth, education, and labor to uncover how these factors collectively shape the socio-economic landscapes of nations worldwide. Leveraging data from the World Bank's World Development Indicators, this visualization series explores eight pivotal metrics across diverse regions, each plot providing unique insights into the global landscape.

Our journey begins with a global overview of population growth and migration patterns, capturing movements between and within rural and urban areas. From there, we investigate literacy rates and labor force dynamics, highlighting gender differences in labor participation. Gender-focused analyses on wage employment and youth engagement in education and the workforce shed light on regional disparities and varied economic contexts. Finally, by comparing educational attainment with GDP per capita, we reveal how education aligns with economic development across time and regions. Together, these visualizations present a cohesive narrative, illustrating how demographic trends, educational advancement, and labor force engagement are deeply interconnected across borders, forming a shared socio-economic fabric.
